## Health and Education

Health issues in Uttarakhand have shown mixed progress. While the state's infant mortality rate, which is already lower than the national average, is declining, malnutrition levels among most households remain high. And although open defecation is more prevalent among the poor, the overall rates in Uttarakhand are lower than in most other Indian states. As for education, more of Uttarakhand's adults have completed secondary school than in many other states, and a larger share of its children are now in school than before. But, while it is heartening to note that the state ranks high on learning outcomes, these levels have stagnated in recent times. Incidentally, enrollment in the state's public school remains high, especially among the low income households.

### Infant mortality is declining in Uttarakhand

### Uttarakhand's infant mortality is lower than the national average
